

Q2. Three-Level ANSI/SPARC Architecture

Q2. THREE-LEVEL ANSI/SPARC ARCHSTCTURE

Provides data independence by separating how data is viewed from how it is stored.

WHAT EACH LEVEL SHOWS / HIDES	
	EXTERNAL LEVEL (View Level) Shows only the required data to each user. Hides the rest of the database.
	CONCEPTUAL LEVEL (Logical Level) Shows the complete logical structure of the database. Hides physical storage details.
	INTERNAL LEVEL (Physical Level) Shows how data is actually stored. Hides storage details from higher levels.

BENEFITS OF THREE-LEVEL ARCHITECTURE	
✓	Provides data independence (logical & physical)
✓	Multiple user views for the same data
✓	Improves security by restricting data access
✓	Easier maintenance and modification
✓	Program-data independence

IN SUMMARY	
	The Three-Level ANSI/SPARC Architecture separates user views, logical structure and physical storage using mappings, providing data independence and efficient data management.

KEY IDEA: Separating views, logical structure and physical storage through mappings ensures that changes at one level do not affect other levels. This is the foundation for data independence in DBMS.
