

Q5. Comparison of Data Models

Q5

Q5. COMPONENTS OF A DBMS

A DBMS is made up of several components that work together to store, manage and provide access to data efficiently and securely.

MAIN COMPONENTS	
	1. Hardware The physical devices on which the database system is installed. Examples: Servers, Storage devices, Computer systems, Peripherals.
	2. Software The programs that control the DBMS and help in managing data. Examples: DBMS software, Operating system, Utility programs.
	3. Data The actual data stored in the database along with its descriptions. Includes: Database, Metadata (Data dictionary).
	4. Procedures The set of rules and instructions for designing, using and maintaining the database. Includes: Policies, Standards, Backup procedures, Recovery.
	5. People (Users) People who interact with the database system. Examples: Database Administrator (DBA), End users, Programmers, System analysts.

FUNCTIONS OF COMPONENTS	
1	Hardware provides the physical resources to store and process data.
2	Software acts as an interface between users and data and manages all database activities.
3	Data is the core asset which is organized and stored in the database.
4	Procedures ensure proper design, usage, security, backup and recovery of the database.
5	People use the database system for different purposes and ensure its effective operation.

IN SUMMARY	
	All these components work together to provide a reliable, secure, efficient and user-friendly environment for storing, managing and retrieving data in a DBMS.

KEY IDEA: A DBMS is not just a software, but a complete system that includes hardware, software, data, procedures and people working together to manage data effectively.
